Final Project Position 18

1. Project Introduction

Kagisho High School is a school located in Bloemfontein with close to 2000 students. The purpose of our project is to find an existing issue within a business and find a solution for it. The school currently sends home paper-based letters/notices/information with learners as a way to communicate important information to parents.

Our proposed solution to the issue Kagisho High School is facing is a digital communication system consisting of a school web portal and a Flutter-based mobile application for parents/guardians. The school will be able to publish announcements and upload important documents through the web portal, and parents will access these announcements and documents directly through the mobile application.

2. Stakeholder and Organisation Profile

2.1 Organisation and Stakeholder

Item	Description
Primary Stakeholder	Kagisho High School — we have identified the communication issue and our proposed solution is being developed for this organisation.
Stakeholder Representative	Principal Motoneshe
Current Users Affected	Principal/School Management, School Administrative Staff, Parents/Guardians, and Learners (indirectly, as current message carriers).

2.2 Key Stakeholders

The following stakeholder groups were identified in the original project analysis:

Principal / School Management

- Interested in improving communication with parents.
- May oversee the publication of important information.

School Administrative Staff

- May operate the web portal.
- Upload and manage announcements and documents.

Parents / Guardians

- Main users of the Flutter application.
- Need reliable access to school information.

Learners

- Indirectly affected because they currently play a role in carrying information between school and home.

Pricinpal Motoneshe from Kagisho Secondary School
18 September 2026 – Recorded Interview
Stakeholder Interview.mp4

3. Current Process.

Step	Current Activity	Person Involved
1	School prepares an important letter, notice, or piece of information for parents.	School staff / management
2	The paper-based letter is given to the learner to take home.	School staff, learner
3	The learner is expected to hand the letter to their parent/guardian.	Learner
4	The parent/guardian receives the information, if the letter reaches them.	Parent/guardian
5	The parent attends or responds to the school communication, if received.	Parent/guardian

3.1 Current Process Challenges

As identified in the original project analysis:

- Students fail, lose, or forget to give parents these letters.
- Parents tend to miss meetings, events, or other school activities as a result.
- The school has a very limited ability to ensure that parents do indeed receive the information.

The main issue is therefore the communication gap between the parents and the school — specifically, that Steps 2 and 3 above frequently fail, breaking the chain of information before it reaches the parent.

4. Problem Statement

Important information gets sent home as paper-based letters, and students are expected to give their parents these letters. However, it has come to the school's attention that most students fail, lose, or forget about these communications.

As a result, parents tend to miss meetings, events, or any other school activities. The school has a very limited ability to ensure that parents do indeed receive the information. Our main problem is therefore the communication gap between the parents and the school.

5. Project Aim and Objectives

5.1 Aim

Our aim is to design and develop a digital communication system that improves communication between Kagisho High School and parents/guardians, by providing a centralised web portal for school staff and a Flutter-based mobile application for parents, reducing the school's reliance on learners to physically deliver notices.

5.2 Objectives

- To improve communication between Kagisho High School and parents/guardians.
- To provide parents with direct access to important school announcements.
- To reduce the school's reliance on learners delivering physical notices.
- To provide school staff with a centralised platform for publishing information.

- To provide a secure and accessible digital communication platform.

6. Project Scope

6.1 Deliverables (In Scope)

Within Scope	Outside of Scope
School web portal	Online school fee payments
Flutter parent mobile application	Learner marks/report management
Parent registration/login	Online examinations
Staff authentication	School transport management
Announcement creation	Full learner attendance management
Announcement management	Parent-to-parent communication
Uploading school letters/documents	Social-media/chat functionality
Viewing announcements	Complete school administration management
Accessing documents	
Notifications	
Database integration	

6.2 Acceptance Criteria

- A staff member can log into the web portal and publish an announcement with a title, description, category, date, and target audience.
- A parent/guardian can register, log in, and view announcements relevant to their child's grade within the mobile application.
- An uploaded school letter/document can be attached to an announcement and successfully opened by a parent through the mobile application.
- A parent receives a notification when a new, important announcement is published.
- Data entered or published via the web portal is available to the parent application through the shared backend within [XX] seconds.

6.3 Constraints

- The prototype must be built using Flutter (mobile), ASP.NET (backend/web) and Supabase (database), as required by the module.
- Development must be completed within the ITC327W semester timeline.
- Only fictional, anonymised, or test data may be used for parents, learners, and announcements during development and demonstration, given that real learner/parent data is personal information.
- The system itself will not be responsible for physically scanning documents — staff must convert physical letters to digital format (e.g. PDF or image) before upload.

6.4 Assumptions

- The stakeholder (Kagisho High School) remained available for feedback and validation throughout all three phases.
- Parents/guardians have access to a smartphone and basic internet connectivity to use the mobile application.
- School administrative staff will be available and willing to convert and upload physical letters as part of their existing workflow.
- Group members have, or will acquire, sufficient skill in Flutter, ASP.NET, and Supabase within the project timeline.

7. Stakeholder Needs.

Stakeholder Need (to be confirmed)	Source / Evidence
A reliable way to ensure parents receive important information	18 September 2026
Reduced dependence on learners to deliver physical letters	18 September
Ability to send specific information to targeted grades.	18 September

8. Stakeholders and User Groups

Stakeholder / User Group	Role in the Project or System
Kagisho High School	External stakeholder whose communication problem is being

Stakeholder / User Group	Role in the Project or System
	addressed.
Principal / School Management	Interested in improving communication with parents; may oversee publication of important information.
School Administrative Staff	Operate the web portal; upload and manage announcements and documents.
Parents / Guardians	Main users of the Flutter application; need reliable access to school information.
Learners	Indirectly affected; currently responsible for carrying information between school and home.
Group ELEV8	Student development team responsible for requirements, design, development, testing and documentation.

9. Functional Requirements

ID	Requirement
FR1	The system will allow authorised school staff to log into the web portal.
FR2	The system will allow authorised staff to create and publish announcements.
FR3	The system shall allow staff to upload relevant school documents and letters.
FR4	The system will let staff edit or remove published announcements.
FR5	The Flutter application will allow parents/guardians to register and log in.
FR6	Parents/guardians will be able to view school announcements from the application.
FR7	The application will allow parents/guardians to access uploaded school documents.
FR8	Notifications will be provided for important announcement by system.
FR9	The system will store announcement and user information securely.
FR10	Information published by authorised staff will become accessible to the intended parent users.

10. Non-Functional Requirements

ID	Category	Requirement
NFR01	Security	Only authorised users should be able to access certain system functions.
NFR02	Usability	The Flutter application should be simple and easy for parents with different levels of technological experience to use.
NFR03	Performance	Announcements and documents should load within a reasonable amount of time.
NFR04	Reliability	Information published by the school should be stored accurately and remain accessible.

ID	Category	Requirement
NFR05	Availability	Parents should be able to access important school information when needed.
NFR06	Maintainability	The system should be designed so that it can be maintained and improved in the future.

11. Flutter Requirements

- The Flutter application shall allow parents/guardians to register and log into their accounts.
- It shall provide access to the application's home/dashboard.
- It shall allow parents to view school announcements, including those relevant to their child's grade.
- It shall allow parents to open and access attached school letters/documents.
- It shall provide notifications when important information is published.
- It shall allow parents to view previously published announcements.
- It shall allow parents to log out securely.
- It must use the shared backend so that information remains consistent with the web portal.

12. ASP.NET Requirements

- The ASP.NET backend shall handle requests from the mobile application.
- It shall support authorised staff authentication for the web portal.
- It shall support creation, editing, and removal of announcements, including title, description, category, date, priority, and target audience.
- It shall support uploading and attaching digital school letters/documents to announcements.
- It shall support user-related operations (staff and parent accounts).
- It shall handle communication with the Supabase database.
- It shall process and return information to the Flutter application.

13. Supabase and Integration Requirements

13.1 Supabase Requirements

Supabase will be used for data storage and database-related services, storing information such as:

- Parent/guardian accounts
- User information
- Announcements
- School documents
- Dates and other relevant system information

13.2 Integration Requirements

Integration ID	Requirement
INT01	The Flutter application and the ASP.NET backend shall communicate through a defined set of API requests.
INT02	The ASP.NET backend and Flutter application shall both connect to the same Supabase project (database and storage), ensuring a single source of truth.
INT03	An announcement or document published through the web portal shall become available to the Flutter application without manual synchronisation.
INT04	User authentication (staff and parent accounts) shall be managed consistently through the shared backend.
INT05	Integration testing shall check connectivity, login, and cross-application data sharing between the web portal and the mobile application.

Integration architecture: Flutter mobile application → ASP.NET backend → Supabase database/storage ← School Web Portal.

14. Feasibility Study

14.1 Technical Feasibility

The project is technically feasible because the required technology stack (Flutter, ASP.NET, Supabase) is defined by the module and is well suited to a communication/announcement system of this scale. The main technical challenges are integrating the three technologies, implementing reliable notifications, and ensuring uploaded documents remain accessible and correctly linked to announcements.

Conclusion: Feasible, provided integration and notification functionality are tested early.

14.2 Operational Feasibility

The project is operationally feasible because it addresses a real, confirmed pain point (letters not reaching parents) with a solution that fits naturally into existing school communication habits. The main operational consideration is parent digital literacy and device access, since parents have varying levels of comfort with mobile apps.

Conclusion: Feasible, provided the mobile application remains simple and staff receive basic on boarding on the web portal.

14.3 Economic Feasibility

As an academic prototype, the project relies primarily on free-tier tools: Flutter and ASP.NET are free frameworks, and Supabase offers a free tier suitable for this scale. The main resources required are group members' time, personal computing devices, and internet access, all already available to the group.

Conclusion: Economically feasible for a prototype; note that Supabase free-tier storage limits could matter if many documents/attachments are uploaded during testing.

14.4 Schedule Feasibility

The project must move from planning and requirements through system design, development, integration, testing, and final presentation within the ITC327W semester. Given the number of features described (staff publishing workflow, parent registration/login, document attachment and access, notifications), the group should prioritise the core communication loop first (publish → store → notify → view → access document) and treat features such as read/open-status tracking as secondary.

Conclusion: Feasible with changes — recommend an MVP of staff login, announcement publishing with attachment, parent login, and

viewing/accessing announcements, with notifications and open-status tracking as secondary priorities.

14.5 Legal Feasibility

- Only fictional, anonymised, or test data shall be used for parent, learner, and announcement records during development and demonstration, no real learner or parent personal information will be used.
- Access to the web portal and any parent/learner data shall be restricted to authorised staff through login-based access control.
- Passwords, API keys, and Supabase service-role keys shall never be committed to GitHub.

14.6 Ethical Feasibility

- The stakeholder has been informed (or will be informed) that this is an educational prototype, not a production system.
- The group will be transparent about the prototype's current limitations and will not present it as fully deployment-ready.
- Given that the underlying real-world users include children's guardians and, indirectly, the children themselves, particular care will be taken not to use any real learner names, grades, or contact details in any demonstration.

Conclusion: Feasible, provided stakeholder consent, transparency, and strict use of anonymised/fictional data are maintained throughout.

14.7 Overall Feasibility Conclusion

Overall, the Kagisho High School Digital Parent Communication System is assessed as FEASIBLE WITH CONTROLLED CHANGES. The technology stack is appropriate and low-cost, the problem is clearly evidenced by the school's own observation that letters are frequently lost, and the solution directly targets the point of failure (physical, learner-mediated delivery). The main adjustments required are: (1) prioritising the core publish-to-access workflow as the MVP, (2) treating notifications and open-status tracking as secondary features, and (3) applying strict data-handling discipline given that the system touches parent and, indirectly, learner information.

15. Project Risk

ID	Risk Statement	Category	Likelihood	Impact	Score/Level	Mitigation
R01	Group members lack sufficient Flutter/ASP.NET/Supabase experience, delaying development.	Technical	High	High	High (9)	Allocate early self-study time; use official documentation and tutorials from Week 5.
R02	Stakeholder (Kagisho High School) becomes unavailable or unresponsive during a critical feedback period.	Stakeholder	Medium	High	High (6)	Schedule recurring check-ins in advance; confirm requirements in writing after each engagement.
R03	Notifications fail to reach parents reliably (a core value proposition of the system).	Technical	Medium	High	High (6)	Test notification delivery early and across multiple devices; have a fallback (e.g. in-app announcement list) if push notifications are unreliable.
R04	Parents have limited smartphone access or digital literacy, reducing adoption of the mobile app.	Operational	Medium	Medium	Medium (4)	Confirm typical parent device/internet access with the stakeholder; keep the app interface as simple as possible.
R05	Real or sensitive parent/learner information is accidentally used in development or demonstration.	Legal/Ethical	Low	High	Medium (5)	Use only anonymised/fictional test data throughout; review all demo data before presentations.
R06	Scope creep: additional features are requested	Scope	Medium	Medium	Medium (4)	Log all new requests in the Requirements

ID	Risk Statement	Category	Likelihood	Impact	Score/Level	Mitigation
	beyond the agreed scope.					Change Log; confirm changes with the stakeholder before implementing.
R07	Data synchronisation issues arise between the Flutter app, ASP.NET backend, and Supabase.	Technical	Medium	High	High (6)	Design and test the Supabase schema and API contracts early; test integration continuously rather than only at the end.
R08	Project schedule slips due to underestimating integration and testing effort.	Schedule	Medium	High	High (6)	Build schedule buffer around integration/testing; prioritise the core MVP workflow first.
R09	Confidential information or credentials are accidentally committed to GitHub.	Security	Low	High	Medium (3)	Use environment variables and a .gitignore for all keys; review commits before pushing.
R10	Uneven group member contribution affects project quality and timelines.	Team/Org.	Medium	Medium	Medium (4)	Use Microsoft Project and GitHub to track individual tasks; raise concerns with the lecturer early if unresolved.

15.1 Three Highest-Priority Risks

- R01 – Insufficient Flutter/ASP.NET/Supabase experience within the group (High).
- R03 – Notification delivery reliability, since this is central to the value proposition (High).
- R07 – Data synchronisation issues between the mobile app, backend, and Supabase (High).

16. Requirements Change Log

Version	Requirement/Scope Change	Reason	Decision
V1.0	Broad school-communication concept	Initial stakeholder problem identification	Proposed
V1.1	Online fee payments, marks/report management, online examinations, transport management excluded	Keep scope focused on the communication gap rather than broader school administration	Deferred/Excluded
V1.2	Full learner attendance management, parent-to-parent communication, and social-media/chat functionality excluded	Reduce schedule and complexity risk; not part of the core communication problem	Deferred/Excluded
V1.3	Notifications and document attachment confirmed as core features	Directly addresses the stakeholder's core problem (missed information)	Included

17. Refined Project Scope

Following the feasibility and risk analysis in Sections 14–15, the scope carried forward into system design is:

Core (must be delivered)

- Staff authentication and web portal access
- Announcement creation, editing, and removal
- Document upload and attachment to announcements
- Parent registration and login

- Viewing announcements and accessing attached documents on the mobile app
- Shared Supabase backend integration between web portal and mobile app

Supporting (delivered if time permits)

- Push notifications for important announcements
- Staff visibility into whether parents have opened an announcement
- Audience targeting by grade and priority levels on announcements

18. Relevant Stakeholder Evidence

Evidence	What Should Be Included
Stakeholder meeting	Date, attendees, purpose, problems discussed, requirements identified, and decisions made.
Requirement confirmation	Evidence that the stakeholder confirmed the identified requirements.
Scope confirmation	Evidence that the proposed solution addresses the stakeholder's problem.
Follow-up communication	Relevant email, Teams, or WhatsApp communication where applicable.
Current-process evidence	Any appropriate evidence demonstrating how letters are currently distributed and where they get lost.

18.1 Stakeholder Representative

Name/designation: *Principal Motoneshe*

Date of stakeholder engagement: *18 SEPTEMBER 2026*

Evidence reference/appendix number:

18.2 Evidence Handling

- Do not include unnecessary personal information, especially regarding learners (minors).
- Do not attach confidential documents unless approved and required.
- Do not include passwords, private keys, or other credentials.
- Anonymise evidence where necessary.
- Use fictional, anonymised, or test data for all prototype demonstrations.

19. System Technologies

19.1 Flutter Application

Flutter will be used to develop the parent-facing mobile application. It will provide the interface through which parents/guardians can:

- Log in
- View announcements
- Access documents
- Receive important updates
- Interact with the system from their mobile devices

19.2 ASP.NET Backend

ASP.NET will provide the backend services that allow the different parts of the system to communicate. It will handle things such as:

- Requests from the mobile application
- User-related operations
- Announcement-related operations
- Communication with the database
- Processing and returning information to the application

19.3 Supabase Database

Supabase will be used for data storage and database-related services. It can store information such as:

- Parent/guardian accounts
- User information
- Announcements
- School documents
- Dates and other relevant system information

20. Importance / Benefits

20.1 For Kagisho High School

- Improves communication with parents.
- Provides a central place for school announcements.
- Reduces reliance on physical letters.
- Makes publishing information easier.
- Provides a more organised communication process.

20.2 For Parents/Guardians

- Direct access to school information.
- Less dependence on learners bringing letters home.
- Easier access to important announcements.
- Ability to view information from their mobile device.
- Reduced likelihood of missing important school notices.

20.3 For Learners

- Reduces their responsibility for delivering important school communications.
- Helps ensure their parents receive information directly.

21. Conclusion

As ELEV8, we identified a communication gap at Kagisho High School where important announcements, letters and notices may not always reach parents when they are sent home through learners. Our proposed solution is a digital communication system consisting of a school web portal and a Flutter mobile application for parents and guardians

The system will allow school staff to publish announcements and upload important documents, while parents can access this information directly through the application and receive notifications. Using Flutter, ASP.NET and Supabase, our aim is to provide Kagisho High School with a more reliable, organised and accessible way of communicating with parents.

Appendix A – Requirements Coverage Checklist

No.	Required Area	Location in Document	Status
1	Stakeholder and organisation profile	Section 2	Included (representative TBC)
2	Current process	Section 3	Added
3	Problem statement	Section 4	Included (original)
4	Project aim and objectives	Section 5	Aim added; objectives original
5	Project scope (incl. acceptance criteria, constraints, assumptions)	Section 6	Scope original; rest added
6	Stakeholder needs	Section 7	Added – pending evidence
7	Stakeholders and user groups	Section 8	Included (original)
8	Functional requirements	Section 9	Included (original) – gaps flagged
9	Non-functional requirements	Section 10	Included (original) + IDs added
10	Flutter requirements	Section 11	Added (derived from original)
11	ASP.NET requirements	Section 12	Added (derived from original)
12	Supabase and integration requirements	Section 13	Supabase original; integration

No.	Required Area	Location in Document	Status
			added
13	Feasibility study (all 6 areas + conclusion)	Section 14	Added in full
14	Project risk register	Section 15	Added in full
15	Requirements change log	Section 16	Added in full
16	Refined project scope	Section 17	Added in full
17	Relevant stakeholder evidence	Section 18	Added – pending evidence

Final Project Position

Area	Current Position
Project	Kagisho High School Digital Parent Communication System
Problem	Paper-based letters/notices frequently fail to reach parents, causing missed meetings, events, and school activities.
Gap	No reliable, direct, traceable communication channel between the school and parents that does not depend on learners physically delivering letters.
Solution	Integrated Flutter (parent) + ASP.NET (backend) + Supabase (database) system, with a school web portal for staff.
Core improvement	Direct, reliable, notification-driven communication that reduces reliance on physical, learner-mediated delivery.
Feasibility	Feasible with controlled changes (draft – confirm with group).
Next phase	System architecture and design — pending stakeholder evidence and requirements confirmation.

Implementation and prototype

The final prototype implements a digital communication system that replaces paper-based communication between schools and parents. The school uses a *website* to create and manage announcements, while parents use a *mobile app* to receive, read, and reply to announcements. No paper work is required.

2. Implemented Functions

*School - Website:
- Log in securely
- Create, edit and delete announcements
- Select recipients (whole school, grade, or class)
- Send announcements instantly to the parent app

- View sent announcements history
- Read and reply to parent responses

*Parent - Mobile App:
- Log in securely
- View all announcements for their child/children
- Receive notifications for new announcements
- Mark announcements as read
- Reply to announcements directly from the app

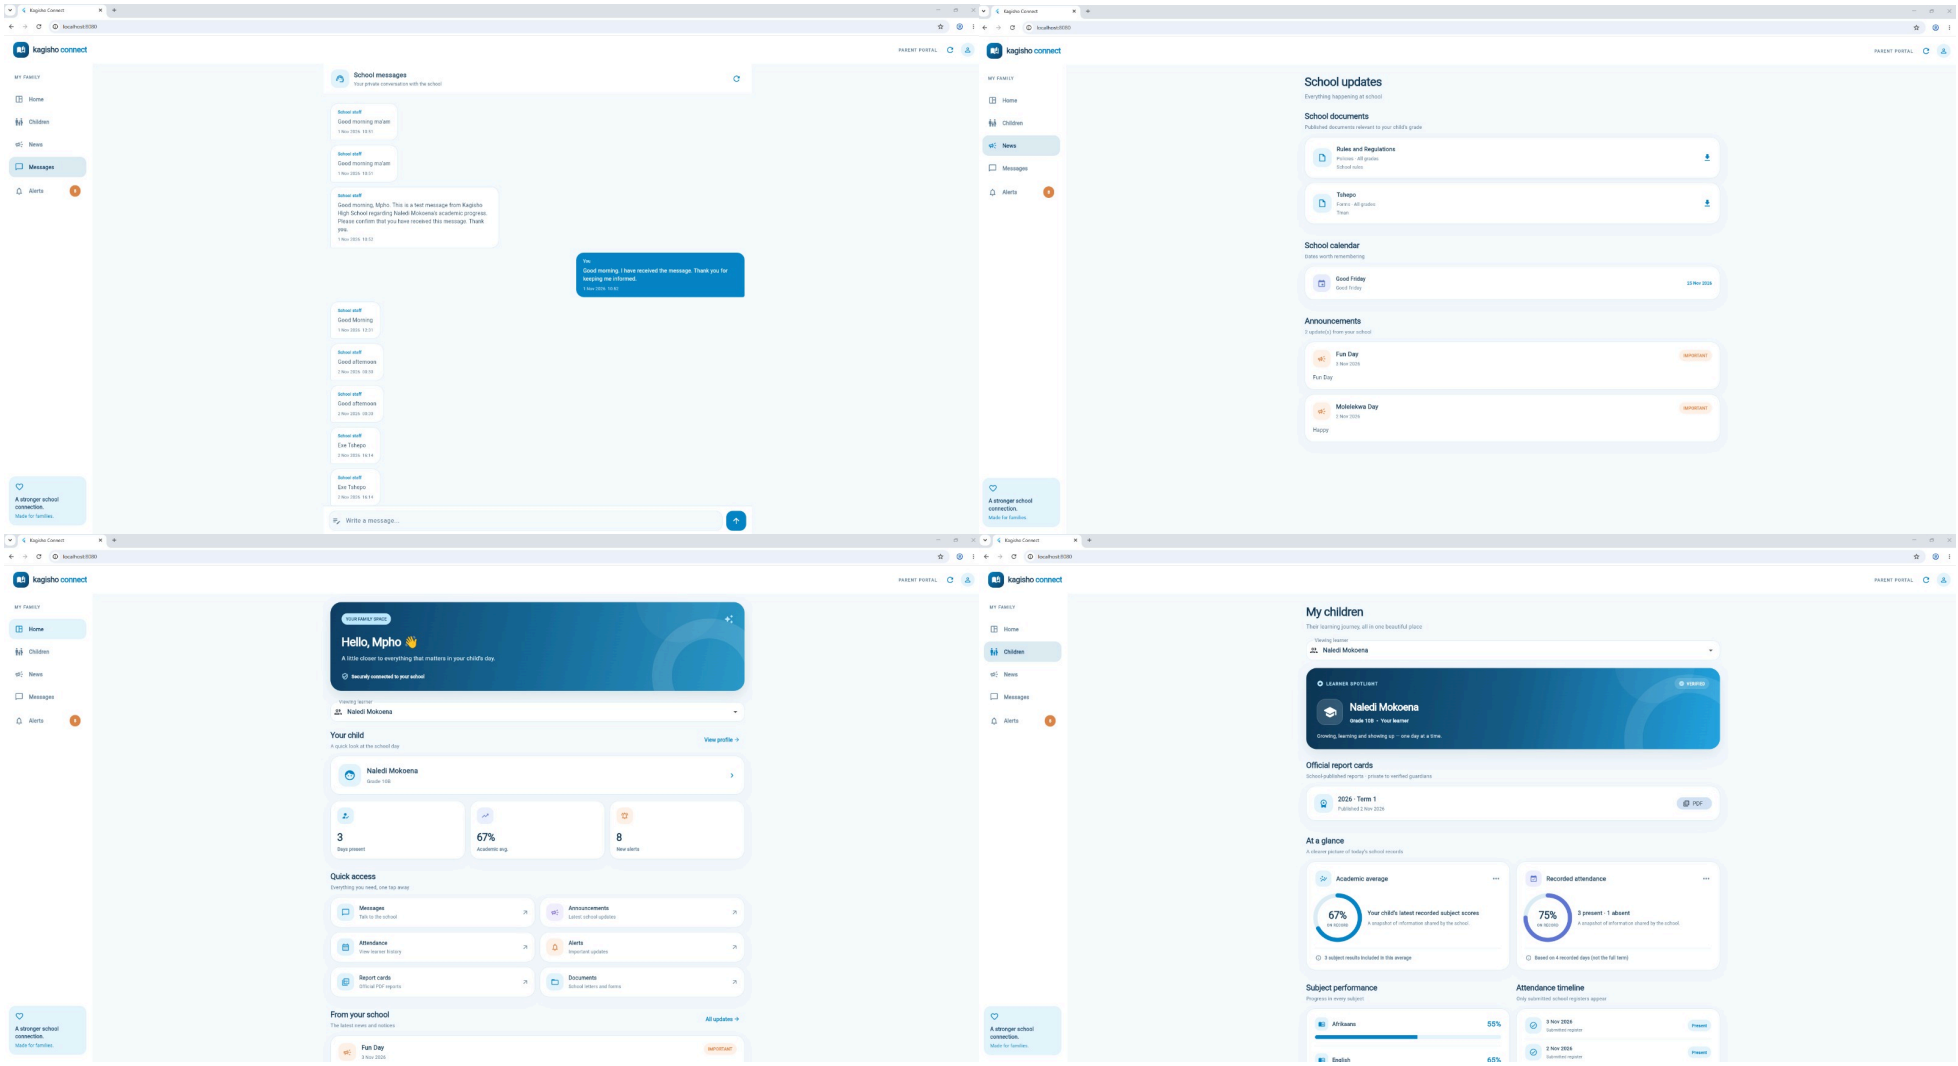

*System:
- Secure login and authentication for both website and app
- Shared announcement database - what the school posts on the website appears immediately in the parent app
- Two-way communication - replies from parents appear on the school website

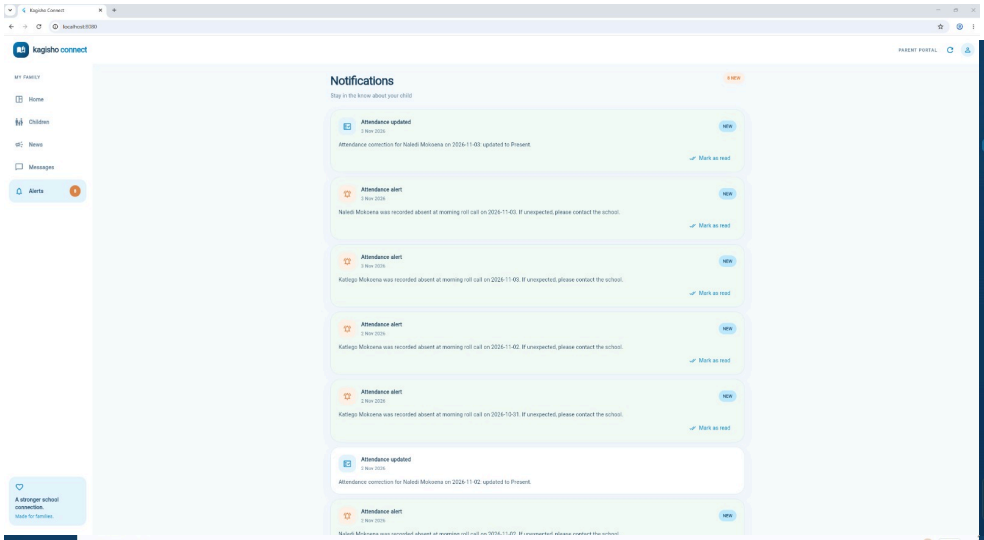

3. Shared Processes
- Login / Authentication: Used by both school staff (website) and parents (app).
- Announcemet Database: Both platforms share the same database. A single announcement is created once and visible on both sides.
- Notifications: When the school posts, parents get a notification. When a parent replies, the school gets a notification.
- Messaging / Reply Thread: The reply process is shared - messages are stored centrally so both sides see the same conversation.
- User Management: School manages parent accounts linked to learners.

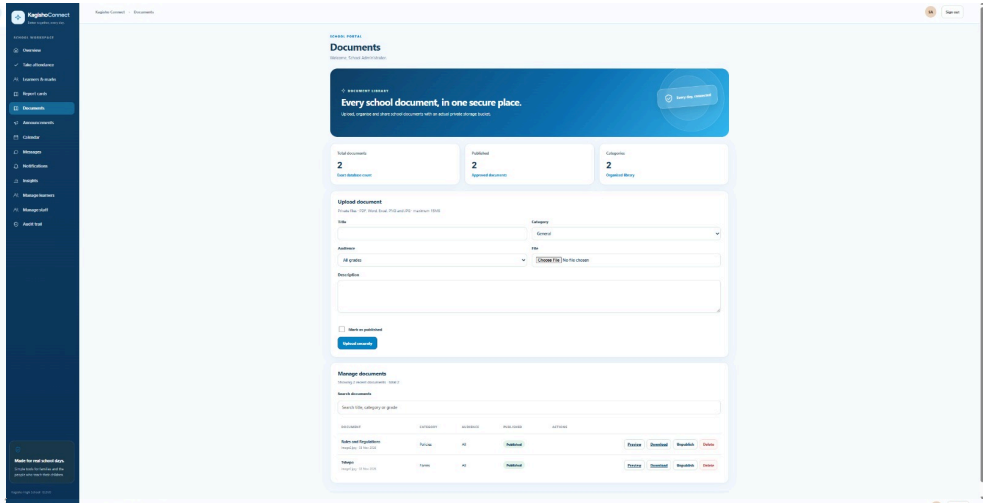

4. Important Approved Changes
- Changed from one-way paper letters to two-way digital communication, as approved in Phase 2.
- Split the system into two platforms as approved: Website for school, Mobile App for parents.
- Added reply function after feedback - parents can now respond instead of only reading.

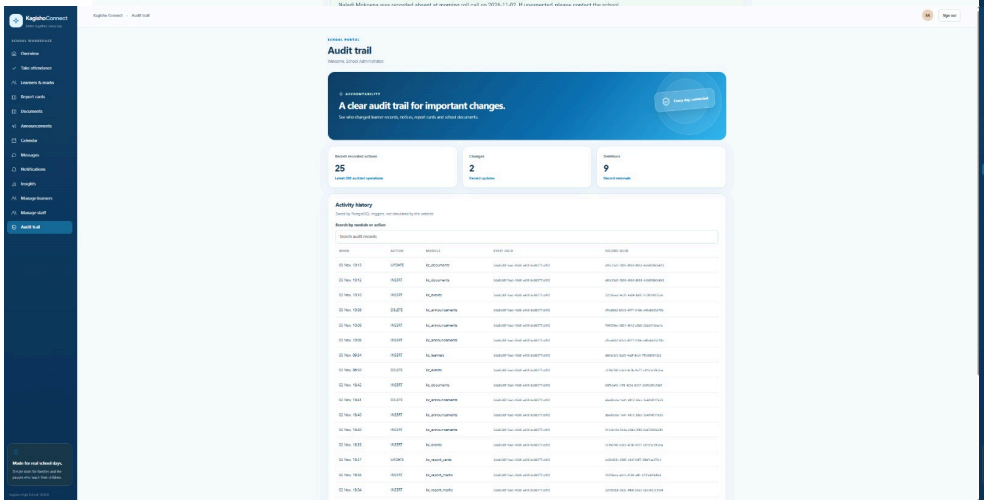

5. Known Limitations
- Parents need internet/data to view announcements and reply - no offline mode yet.
- Announcements are text-based only - no PDF attachments or images yet.
- Replies are text-only, no voice notes or file sharing.
- No SMS fallback if the parent does not have the app installed.
- No multi-language support yet.
